Customer segment insights

Shehroz Khan, Business Analyst, Team 7
12 November 2026

The four groups below follow Dilina's saved cluster names and results. Overall churn is 26.54% across 7,043 records. Customers with short tenure and high charges are the first priority for a retention trial (Chamika, 2026).

Short Tenure High Charges

Cluster 0 has 2,202 records and 1,083 recorded churners, giving a churn rate of 49.18%. Average tenure is 14.81 months and average monthly charges are 81.23 in the dataset's original units. Trial an early support call with a plan review to check whether the service meets the customer's needs.

Short Tenure Low Charges

Cluster 1 has 1,733 records and 424 recorded churners, giving a churn rate of 24.47%. Average tenure is 10.48 months and average monthly charges are 32.49 in the dataset's original units. Trial a simple welcome check-in to explain the service and help customers resolve problems getting started.

Long Tenure High Charges

Cluster 2 has 1,948 records and 306 recorded churners, giving a churn rate of 15.71%. Average tenure is 58.76 months and average monthly charges are 93.08 in the dataset's original units. Offer a service and plan review when the customer's needs change.

Long Tenure Low Charges

Cluster 3 has 1,160 records and 56 recorded churners, giving a churn rate of 4.83%. Average tenure is 54.10 months and average monthly charges are 34.15 in the dataset's original units. Use a light-touch renewal check-in while keeping the service reliable.

How to use the findings

The actions are proposals for testing. A trial should use a defined follow-up period and compare retention outcomes with the usual service, including the cost of contact and any offer. The recorded churn rates have no stated reporting period. Charges have no confirmed currency in the source file.
